

DIGITAL LITERACY PROJECT REPORT

Name - DEVANAND R

Registration No. - 25BHI10067

Branch - B-TECH CSE -HEALTH INFORMATICS

Course Core - CSE0001

Date - MARCH 2026

Introduction

This report is about Digital Literacy and Professional Communication. It is for students in the field of Computer Science Engineering with a specialization in health informatics and other branches also. In today's world it is very important to know how to use platforms safely and have a good online presence. This is a must for career success.

The following sections talk about how to write emails, including templates for academic requests and internship inquiries. It also talks about how to be safe on media, which includes managing your reputation and avoiding cyber threats like phishing and identity theft. By following these standards students can build a digital footprint and protect their professional identity.

Project Report: Create a Digital Literacy Awareness Infographic

Task : 1

Student Name: DEVANAND R

Institution: VIT BHOPAL

I used Canva to make a one-page resource to increase digital literacy awareness among my batchmates. I chose this platform because it has templates and icons that helped me create a high-quality and professional layout.

My design covers three parts of modern digital citizenship:

- **Defining Digital Literacy:** I gave a basic definition that emphasizes the ability to find, evaluate and communicate information using critical thinking.
- **Safe Internet Practices:** This section talks about security measures like using strong and unique passwords being careful when clicking on links and using VPNs on public Wi-Fi.
- **Professional Email Etiquette:** I included a guide for academic and professional communication focusing on formal greetings clear body text and avoiding informal language or excessive emojis.

I learned that making an infographic is not just about the information, but also about how it looks. I had to use whitespace and typography to make sure the page was not too cluttered. I found out that effective digital communication is as much about the visual delivery as it is about the technical content.

Project Report: Professional Digital Portfolio Setup

Task : 2

Student Name: DEVANAND R

Institution: VIT BHOPAL

I set up my digital presence using LinkedIn, GitHub and Kaggle. These tools help me show my journey, technical skills and problem-solving abilities in the field of Computer Science Engineering with a specialization in HEALTH INFORMATICS

Each platform has a use:

- LinkedIn: This is my networking hub. I updated my education section to reflect my degree and expected graduation year so I can connect with industry experts and track internship opportunities.
- GitHub: I use this to store my coding projects and technical documentation. I made a profile README to showcase my work and interest in forensics.
- Kaggle: This platform lets me explore the intersection of data science and security. I participate in community-led competitions. Analyze security-related datasets to build my analytical skills.

Over the four years I plan to use these platforms to grow academically and professionally. I will use GitHub to host my portfolio of scripts and security tools. On Kaggle I aim to become a contributor by developing threat-detection models and participating in data science challenges. I will use LinkedIn to document my project milestones and build a digital footprint to secure a career in HEALTH INFORMATICS.

Project Report: Digital Literacy Assessment and Data Management

Task : 3

Student Name: DEVANAND R

Institution: VIT BHOPAL UNIVERSITY

I used Google Forms and Google Sheets to make a "Digital Literacy Awareness Quiz". I chose these platforms to practice real-time data collection and simulate user-end assessments often required in cybersecurity awareness training.

I built a five-question assessment covering digital literacy concepts. I created multiple-choice questions and a short-answer reflection on portfolios. I used the "Quiz" feature in Google Forms to set up an answer key and assign points to the assessment. I linked the form to a Google Sheet to manage and monitor responses.

Mastering these tools is important for my specialization in Health informatics. Being able to organize and interpret datasets is a must for forensic evidence management and incident reporting. This project helped me practice using office productivity tools to communicate technical security concepts to a wider audience.

Project Report: Professional Email & Etiquette Guide

Task : 4

Role: Student Digital Ambassador

Student Name: DEVANAND R

Institution: VIT BHOPAL UNIVERSITY

I used Microsoft Word and PDF formatting tools to make a "Professional Communication Portfolio". I chose these tools to practice document creation and simulate professional reporting standards required in the Health informatics industry.

I developed a communication suite focusing on professional etiquette and digital safety. I drafted two email templates, including a request for a deadline extension and a structured internship inquiry tailored to my BTech specialization. I also developed a Social Media Do's. Don'ts Checklist to provide actionable steps for maintaining a secure and reputable online presence.

Mastering communication is vital for my specialization in Health informatics. Being able to articulate technical requests and inquiries is a must for incident reporting. This project helped me practice communicating security practices and professional standards to a wider audience.

Project Report: Cybercrime Awareness Case Study & Prevention Guide

Task : 5

Role: Student Digital Ambassador

Student Name: DEVANAND R

Institution: VIT BHOPAL UNIVERSITY

I used research methods and structured documentation to analyze a high-profile financial breach and develop a security framework. I chose these tools to simulate the role of a cybersecurity & Health informatics analyst focusing on incident breakdown and creating awareness materials for a collegiate audience.

Case Study: UPI Fraud in India

UPI fraud has emerged as one of the fastest-growing cybercrimes in India, targeting millions of everyday smartphone users. With the explosive rise of digital payments through apps like **PhonePe**, **Google Pay**, and **Paytm**, fraudsters have found clever ways to exploit unsuspecting victims.

How It Happens: A typical UPI fraud begins with a fraudster posing as a bank official, customer support agent, or even a known contact. They reach out via **phone call, SMS, or WhatsApp**, claiming there is an issue with the victim's account, **KYC verification**, or a pending payment. The victim is then persuaded to share their **UPI PIN, OTP, or click on a malicious link**. In many cases, fraudsters send a **"collect request"** — making the victim believe they are *receiving* money, when in reality they are *approving a payment* from their own account.

Who Is Targeted: Fraudsters primarily target first-time UPI users, senior citizens unfamiliar with digital

transactions, **small business owners, online shoppers, and people selling items on platforms like OLX** or Facebook Marketplace. Anyone who receives an unexpected call offering cashback, refunds, or lottery winnings is also at high risk.

The consequences can be devastating — victims lose hard-earned savings within seconds, and recovery is often difficult.

1. How UPI Fraud Occurs

Fraudsters do not typically "hack" the UPI system; instead, they exploit human psychology through **social engineering**. Common tactics include:

- **The "Collect Request" Trap:** Fraudsters send a payment request to the victim, claiming it is for "receiving" a refund or prize. The victim, thinking they are accepting money, enters their PIN and accidentally authorizes a transfer *out* of their own account.

- **Impersonation:** Attackers pose as bank officials, KYC verification agents, or customer support to gain trust.
 - **Malicious Links/Apps:** Victims are persuaded to click links or download screen-sharing apps that allow hackers to see their OTPs and PINs in real-time.
 - **QR Code Scams:** Fraudsters send QR codes over WhatsApp, telling the victim to "scan this to receive payment" for items being sold on platforms like OLX.
-

2. High-Risk Targets

While anyone can be a target, fraudsters specifically look for vulnerabilities in:

- **First-time digital users:** Those unfamiliar with the "PIN is only for sending" rule.
 - **Senior Citizens:** Who may be less aware of the technical nuances of digital security.
 - **Online Sellers:** Individuals selling products on secondary marketplaces (OLX, Facebook).
 - **Small Business Owners:** Who handle high volumes of digital transactions daily.
-

3. Prevention: The "Stay Safe" Checklist

Digital literacy is the best defense against financial loss. Follow this checklist to stay secure:

- **PIN is for SENDING:** You NEVER need to enter your UPI PIN to receive money. If a screen asks for a PIN, money is leaving your account.
- **Verify the Payee:** Before hitting 'Pay,' check the name displayed on the app after scanning a QR code to ensure it matches the actual person or shop.
- **Don't Click, Search:** Never click on links sent via SMS or WhatsApp for "KYC updates." Always go to the official bank app or website yourself.
- **Beware of Urgency:** Fraudsters create a "fear of loss" (e.g., "Account will be blocked in 2 hours") to make you act without thinking.
- **Limit Screen Sharing:** Never download apps like Anydesk or TeamViewer if requested by a stranger over the phone; these allow them to see your screen and OTPs.
- **Set Transaction Limits:** Use your bank app to set a daily limit on UPI transactions to minimize potential loss.
- **Secure Your Phone:** Use biometric locks (fingerprint/face ID) for your payment apps rather than simple patterns.

- **Immediate Action:** If scammed, call the **National Cyber Crime Helpline at 1930** immediately. The first hour (The Golden Hour) is critical for freezing the stolen funds.
-

4. Summary of Impact

UPI fraud is not just a technical issue; it is a behavioral one. Even users with prior knowledge can fall victim when emotions like fear or excitement are manipulated. True digital literacy means making responsible decisions under pressure.

National Helpline: 1930
