

USEFULNESS OF HACKER RANK

Hacker rank is a global technology platform that serves me a lot of things so that my skills are developed up to an extreme so that I can compete others for high package. It functions as a competitive coding environment where students can solve challenges across 40+ languages, including Python, Java, and SQL. By providing structured "Practice Tracks" in algorithms and data structures, it helps students move beyond theoretical classroom knowledge toward practical, real-world application.

For a student's future, Hacker rank is indispensable as a **standardized verification tool**. Traditional resumes often rely on self-reported skills, but Hacker rank provides "Verified Certifications" and skill badges that act as measurable proof of competency for recruiters. Over 2,000 companies, including tech giants like Google and Peloton, use the platform to conduct initial technical screenings. By practicing on the site, students become acclimated to timed, proctored environments—learning to write "clean," efficient code while under the pressure of a ticking clock.

Beyond just testing, the platform offers "Role-Based" paths that simulate the actual tasks of a Data Scientist or Full-Stack Developer. This allows students to build a portfolio of solved "Projects" that mirror industry requirements. Ultimately, a high ranking on Hacker Rank can lead to direct "headhunting" by recruiters, turning a student's coding practice into a global career opportunity. It transforms the job hunt from a search for "who you know" into a demonstration of "what you can build", I want to say

that it will gives me from **health informatics** branch to compete other branch students like **CSE OR MECHANICAL OR CIVIL** etc.
